If the science is good, we should act before the trials are done

Sometimes it'is best just to jump in

Background

Systematic reviews (SRs) caused an earthquake in the scene of medical literature.

Nowadays SRs are an essential part in health care decision making because only few scientists have sufficient time, knowledge and interest to read carefully and to critically appraise scientific papers.

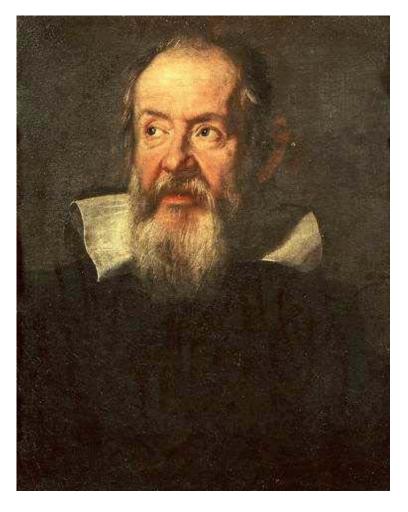

Most scientists will therefore rely on SRs.

Hence the inevitable risk of accepting potentially poor scientific information.

All truths are easy to understand once they are discovered, the point is to discover them

Galileo Galilei (1564-1642)

LESS IS MORE

MIND THE GAP

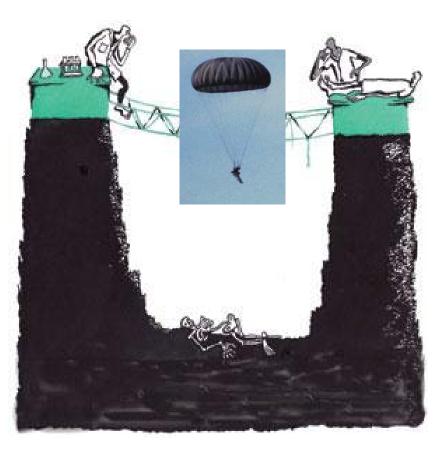

Galileo's scientific method aimed essentially to simplify the phenomena studied by distinguishing them as far as possible from secondary effects that might mask the desired result.

LESS IS MORE !!! You can sit...and do not fall...

MIND THE GAP!!!

AIM

We investigated whether the health quality of hospital care could be improved by forming a multidisciplinary group within the hospital to distill the knowledge acquired, analyze SRs and rapidly translate the reliable information gathered into proper clinical decisions.

Methods

In May 2009, 24 persons (paediatricians,

cardiac surgeons, anaesthetists, statisticians, psychologists, biologists and a librarian) took part in a course aimed to disseminate secondary publications in our paediatric hospital.

As the first task, using the questionnaire proposed by the Critical Appraisal Skills Programme (CASP) they critically analysed a Cochrane SR on interventions for promoting booster seat use in four-to-eight year olds travelling in motor vehicles.

Second, they selected the two key papers (highest Forest plot weights and not overlapping the null hypothesis) in the SR.

Third, using the CASP questionnaire, they critically appraised two key papers in the review.

Methods of the current study

1st step go to SR and check the Forest plot

2nd step identify two or more important studies

3rd step pre-check the study reading if they ask a right question and use the most simple and appropriate design to answer the question posed (ie the same design you might use)

4th step appraise the studies using CASP

5th step accept or refuse the clinical bottom line

Results

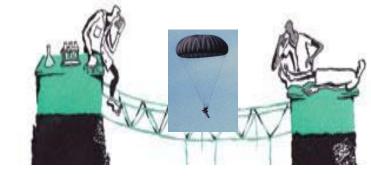

After initially appraising the SR with the CASP questionnaire all of the participants agreed that the eligibility criteria for inclusion in the studies suffered from different bias.

When they carefully read the Bowman paper selected they found that had high weight in the Forest plot but contained numerous flaws that weakened the results (ie limited settings, non homogeneous legislation rules) that led to poor precision, generalisability and applicability of the findings.

Results

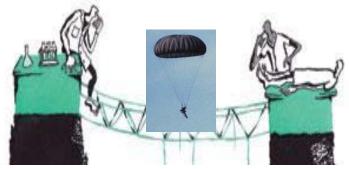

When the course ended, the participants proposed forming a group that could analyse the results of SRs rapidly though reliably.

This group was named G.A.L.I.L.E.O. Gruppo per l'apprezzamento della letteratura e l'implementazione dei livelli di evidenza negli ospedali

Group for Appraising Literature and Implementing Levels of Evidence in hOspitals.

Conclusion

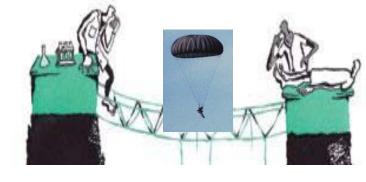

AIM We investigated whether the health quality of hospital care could be improved by forming a multidisciplinary group within the hospital to distill the knowledge acquired, analyze SRs and rapidly translate the reliable information gathered into proper clinical decisions.

The quality of hospital care can be improved by forming a multidisciplinary group that can harmonize the knowledge acquired, analyze SRs and translate the right information into proper clinical decisions.

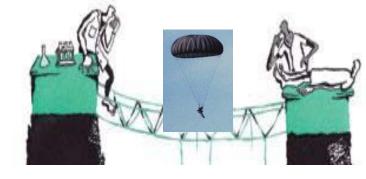

Conclusion

Our study underlines that the quality of a systematic review should undergo careful appraisal before information from the review can be used in clinical practice.

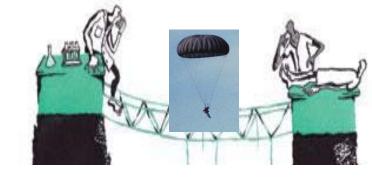

Conclusion

A rapid appraisal nevertheless risks losing important scientific observations and leaving their clinical relevance unclear

Gathering the information requires considerable skills and applying the evidence is time consuming

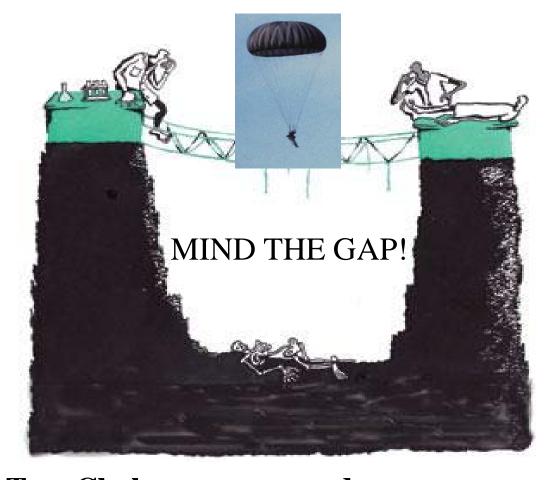

In future

- A 'translational multidisciplinary group' could be formed by few people:
- two clinicians
- a biologist or a basic researcher
- a librarian
- a statistician
- a patient?
