

Playing with BMJ Rapid Recommendations in the MAGIC Evidence Ecosystem

Workshop EBHC Conference Taormina 2019

Per Olav Vandvik, on behalf of colleagues in the non-profit MAGIC Evidence Ecosystem Foundation

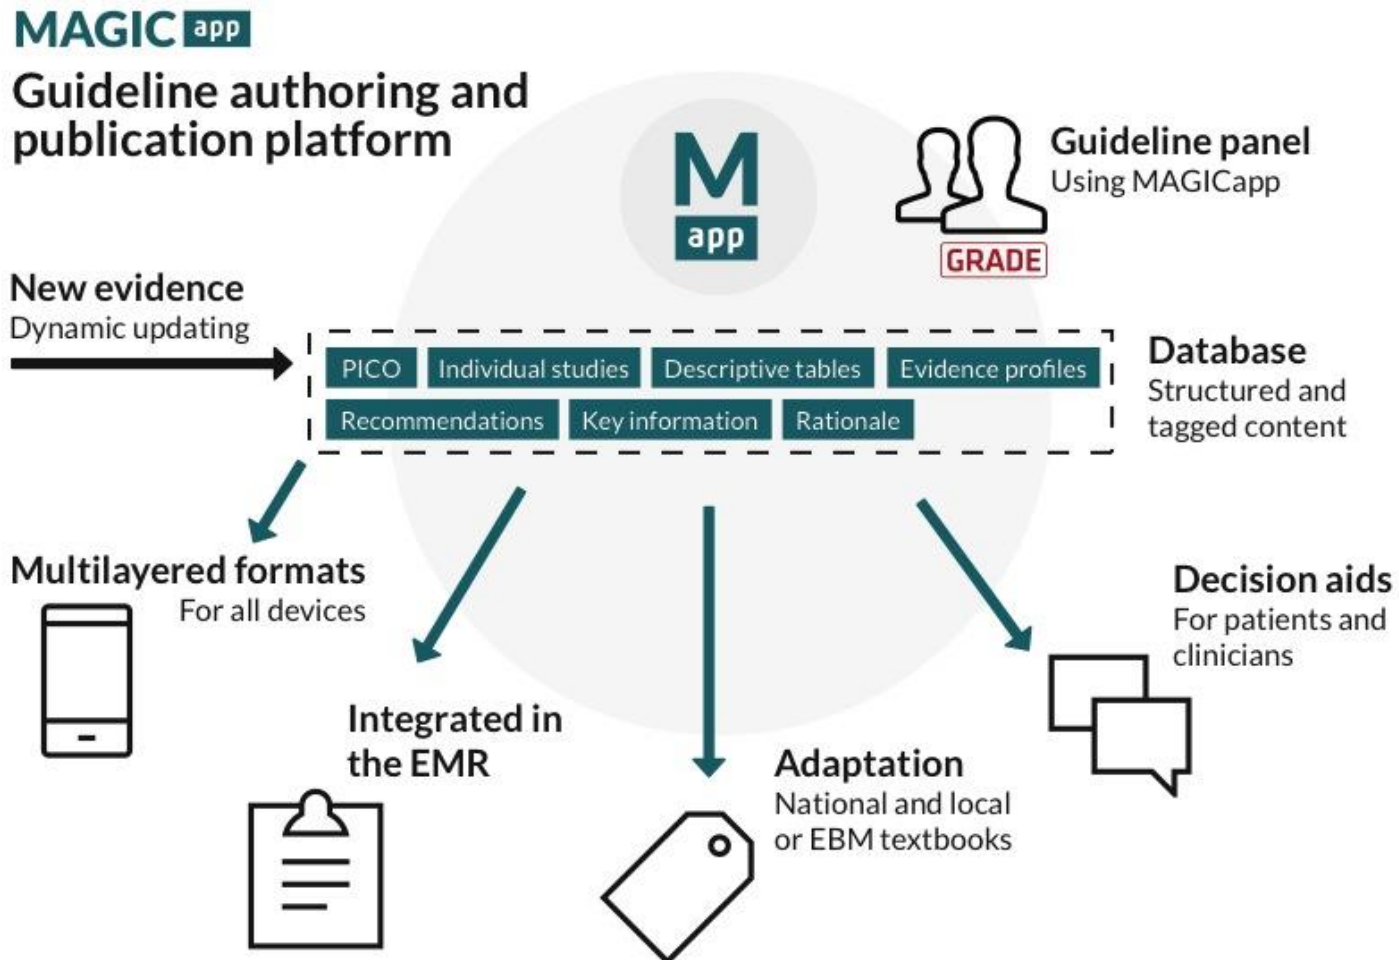

Objectives

1. To understand how MAGICapp works for clinicians and patients, with trustworthy recommendations, evidence summaries and decision aids, exemplified through the BMJ Rapid Recommendations project for practice-changing evidence
2. To be introduced to the process of developing, publishing and dynamically updating a trustworthy recommendation from an existing systematic review, with the GRADE system and the MAGICapp
1. To get hands-on experience with use of the MAGICapp in the creation and dynamic updating of a living guideline recommendation.

Plan for workshop

1. Where does MAGIC and BMJ Rapid Recommendations belong in the Evidence Ecosystem?
2. Playing with a published BMJ Rapid Recommendation in groups, exploring new publication formats in The BMJ and MAGICapp
3. Plenary discussion follows
4. Testing authoring and dynamic updating in MAGICapp (if time permits)
5. In a final plenary discussion feedback on user experience of the MAGICapp will be discussed

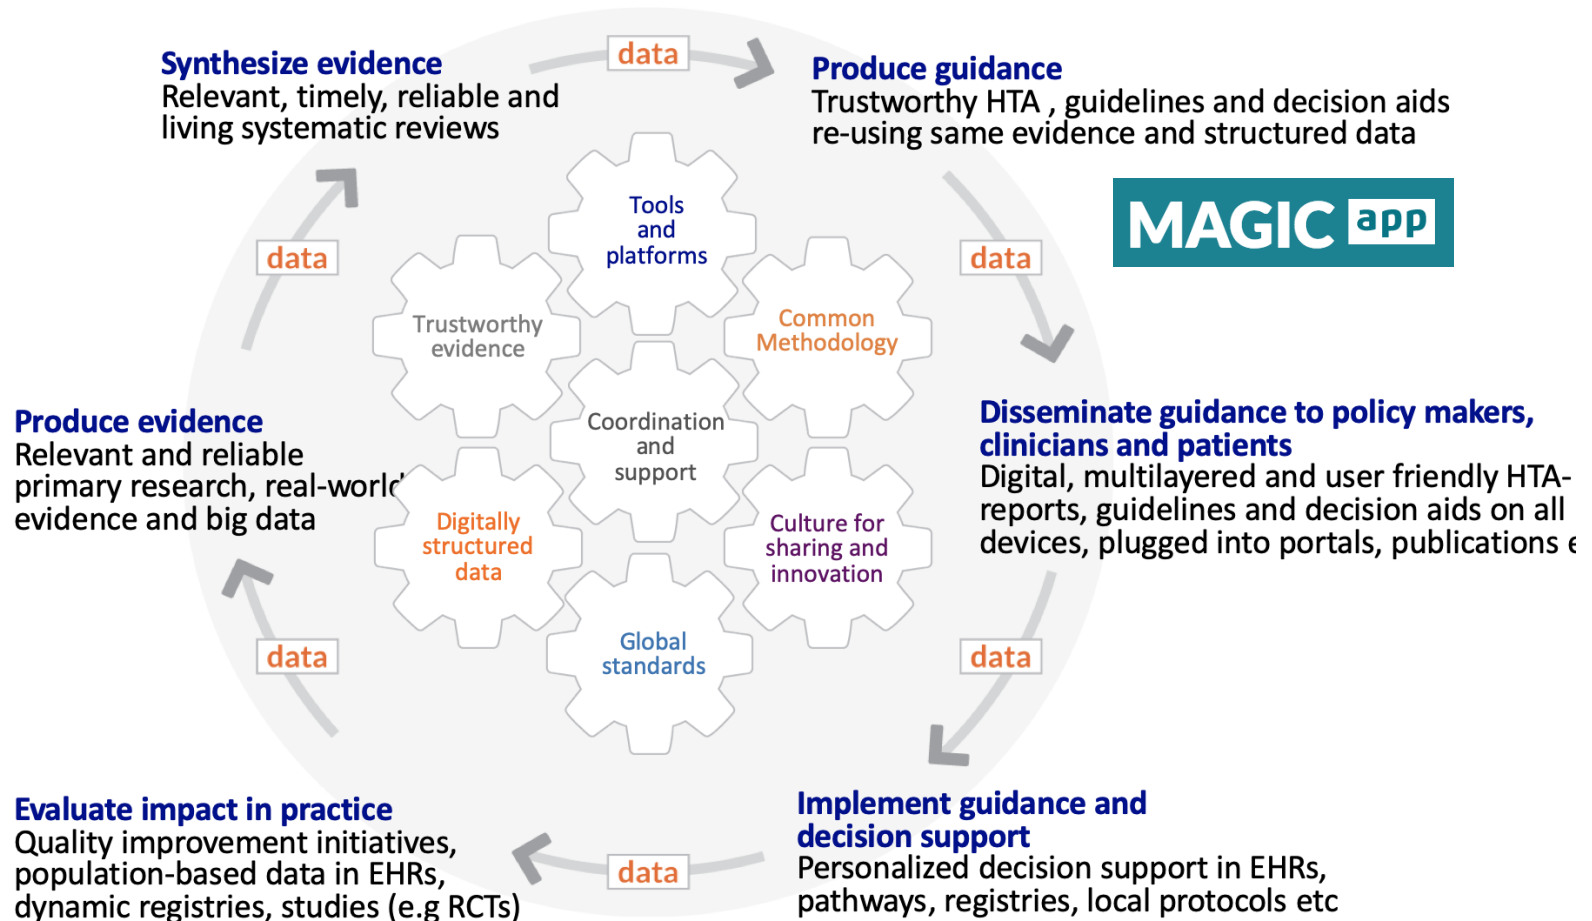

Creating, publishing and dynamically updating trustworthy recommendations, evidence summaries and decision aids in digitally structured formats

Our vision:

A Digital and Trustworthy Evidence Ecosystem

to increase value and reduce waste in health care

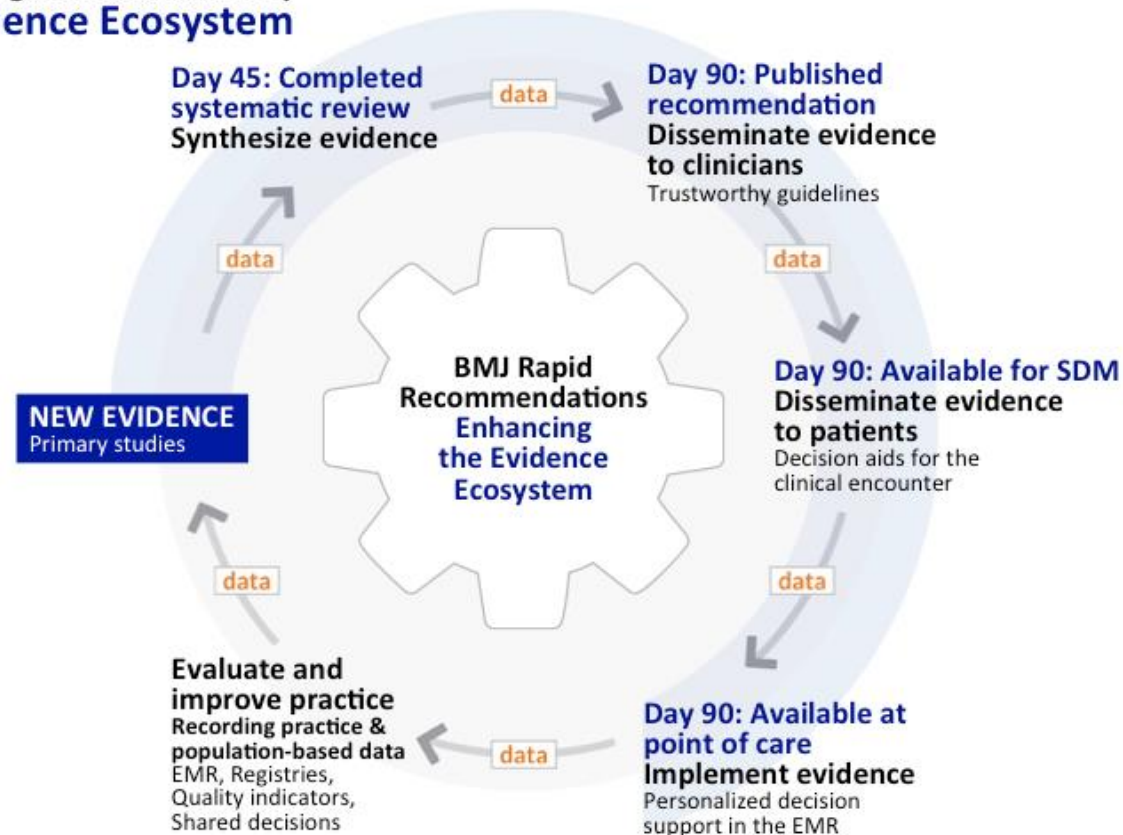

Some hurdles to overcome: Organizations fit for purpose?

How can we rapidly get potentially practice-changing evidence into practice?

Collaborative network approach, partnering with innovative medical journal?

The Digital and Trustworthy Evidence Ecosystem

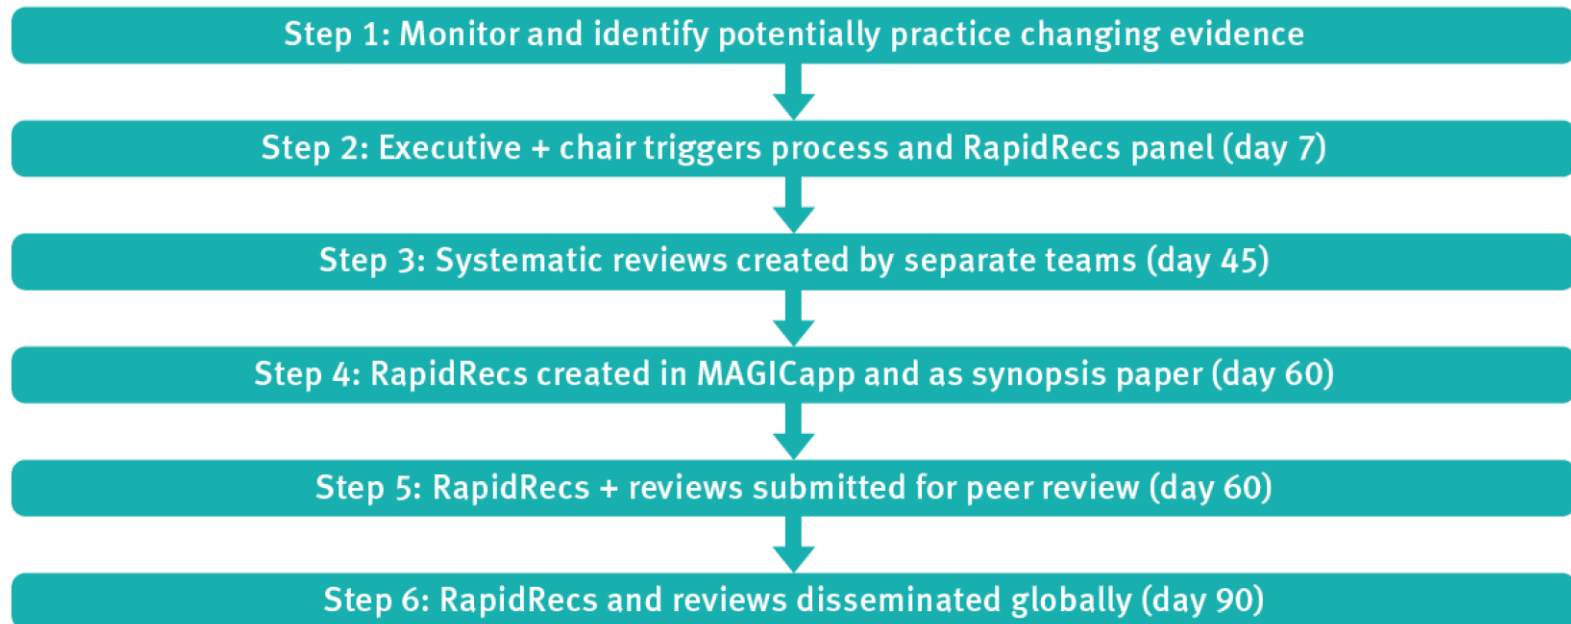

The BMJ-RapidRecs project: methods and process

- Guideline panel, network of the right people
 - ✓ Trustworthy guideline standards, GRADE
 - ✓ Focus on conflict of interest, patient involvement....
- Linked high quality systematic reviews
 - ✓ effects, prognosis, values and preferences
 - ✓ Separate teams, closely interacting with guideline panel

Rapid Recommendations process step by step (with target times)

Potentially practice-changing evidence for Daniel?

Triggering our first BMJ- RapidRecs, published September 28 2016

- Daniel, 69 years old
- Heart failure, not feeling well..
- Severe aortic stenosis, all set up for open heart surgery in Norway
- Read newspaper, questions if he could have “TAVI”...

ABSTRACT

BACKGROUND
Previous trials have shown that among high-risk patients with aortic stenosis, survival rates are similar with transcatheter aortic-valve replacement (TAVR) and surgical aortic-valve replacement. We evaluated the two procedures in a randomized trial involving intermediate-risk patients.

METHODS
We randomly assigned 2052 intermediate-risk patients with severe aortic stenosis, at 57 centers, to undergo either TAVR or surgical replacement. The primary end point was death from any cause or disabling stroke at 2 years. The primary hypothesis was that TAVR would not be inferior to surgical replacement. Before randomization, patients were entered into one of two cohorts on the basis of clinical and imaging findings; 76.5% of the patients were included in the transfemoral-access cohort and 23.7% in the transhoracic-access cohort.

RESULTS
The rate of death from any cause or disabling stroke was similar in the TAVR group and the surgery group (P=0.001 for noninferiority). At 2 years, the Kaplan–Meier event rates were 19.3% in the TAVR group and 21.1% in the surgery group (hazard ratio in the TAVR group, 0.89; 95% confidence interval [CI], 0.73 to 1.09; P=0.25). In the transfemoral-access cohort, TAVR resulted in a lower rate of death or disabling stroke than surgery (hazard ratio, 0.79; 95% CI, 0.62 to 1.00; P=0.05), whereas in the transhoracic-access cohort, outcomes were similar in the two groups. TAVR resulted in larger aortic-valve areas than did surgery and also resulted in lower rates of acute kidney injury, severe bleeding, and new-onset atrial fibrillation; surgery resulted in fewer major vascular complications and less paravalvular aortic regurgitation.

CONCLUSIONS
In intermediate-risk patients, TAVR was similar to surgical aortic-valve replacement with respect to the primary end point of death or disabling stroke. (Funded by Edwards LifeSciences; PARTNER 2 ClinicalTrials.gov number: NCT01314312.)

☑ **Transfemoral Transcatheter aortic valve insertion (TAVI) vs Surgical aortic valve replacement (SAVR)**

Patients 65-75 years with severe symptomatic aortic stenosis who are at low or intermediate perioperative risk

15 Outcomes [Summary](#)

Outcome Timeframe	Study results and measurements	Absolute effect estimates		Certainty in effect estimates (Quality of evidence)	Plain text summary
		SAVR	Transfemoral TAVI		
Mortality, age adjusted 2 years	Hazard Ratio 0.79 (CI 95% 0.66 - 0.94) Based on data from 2576 patients in 3 studies Follow up: 2 years.	92 per 1000	73 per 1000	Moderate Due to serious imprecision	TAVI probably reduces the risk of death.
Stroke (includes perioperative events) 2 years	Relative risk 0.8 (CI 95% 0.63 - 1.01) Based on data from 2576 patients in 3 studies Follow up: 2 years.	70 per 1000	56 per 1000	Moderate Due to serious imprecision	TAVI probably reduces the risk of stroke.
Aortic valve reintervention 2 years	Relative risk 1.5 (CI 95% 1.2 - 1.8) Based on data from 3058 patients in 3 studies Follow up: 2 years.	3 per 1000	5 per 1000	High	TAVI probably increases the risk of aortic valve reintervention.
Aortic valve reintervention - long term 10 years	Relative risk 1.5 (CI 95% 1.2 - 1.8) Based on data from 3058 patients in 3 studies Follow up: 2 years.	61 per 1000	92 per 1000	High	TAVI may increase need for aortic reintervention due to structural valve deterioration

per 100

ESTIMATED ABSOLUTE DIFFERENCE OF INTERVENTION VS. COMPARATOR (CALCULATED)

Difference: 7 more per 1000

CI 95% (1 more - 21 more)

Updating the recommendation: What would the panel recommend be for patients 65-75 years old? (screenshot current)

Patients aged 65 to < 75 years and eligible for transfemoral TAVI or SAVR

Weak recommendation

We suggest SAVR rather than TAVI

This recommendation considers benefits and harms of treatment alternatives with a particular weight on the uncertainty regarding the long-term durability of TAVI valves for those under 75. The age thresholds reflect the key issue, which is expected life span; clinicians need to also consider other factors such as comorbidity.

 Search evidence

Key info

Rationale

Pr

Benefits and harms

 Benefits of TAVI include reduced deaths, strokes, major bleeds, new onset atrial fibrillations and days in hospital over 2 year follow-up. Harms include increased need for aortic reinterventions in the short term over 2 year follow-up. Long term durability of TAVI valves is likely to be reduced compared to SAVR biological valves which suggests increased need for aortic valve reinterventions within the first 10 years.

Quality of evidence

Benefits and harms

▼ Small net benefit, or little difference between alternatives

 Benefits of TAVI include reduced deaths, strokes, major bleeds, new onset atrial fibrillations and days in hospital over 2 year follow-up. Harms include increased heart failure, need for pacemaker insertions and aortic reinterventions in the short term over 2 year follow-up. Long term durability of TAVI valves is likely to be reduced compared to SAVR biological valves which suggests increased need for aortic valve reinterventions within the first 10 years.

Quality of evidence

▼ Moderate

 For transfemoral TAVI versus SAVR, high certainty for decrease in acute kidney injury, bleeding, atrial fibrillation, and hospital length of stay; moderate certainty for decrease in mortality, stroke, recovery time and increase in short term (2 year) aortic valve reintervention, permanent pacemaker, and moderate/severe heart failure; low certainty for decrease in postoperative pain and very low certainty for increase in long term (10 year) aortic valve reintervention.

Preference and values

▼ Substantial variability is expected or uncertain

 Patients are likely to place different value on benefits and harms associated with TAVI. Patients aged 75 or younger - with a life expectancy well beyond 10 years - are likely to place a particularly high value on avoiding need for a second aortic valve replacement and are likely to choose surgery. Patients who place a high value on avoiding initial open heart surgery and are willing to accept an increased risk for aortic valve reintervention are likely to choose TAVI. A systematic review of values and preferences provided limited evidence to inform our judgements. One study showed that patients have high risk willingness for mortality in exchange for perfect health (someone of equal age without aortic stenosis) [14].

Resources and other considerations

▼ Important issues, or potential issues not investigated

 TAVI should be considered only in centres with sufficient expertise utilizing specialized TAVI teams consisting of interventional cardiologists, general cardiologists, cardiac surgeons, and appropriate nursing and adjunctive personnel. Cost-effectiveness of SAVR versus TAVI in low to intermediate risk patients remains uncertain in the absence of available cost-benefit analyses.

Plenary discussion

- Digital authoring of evidence summaries, recommendations and decision aids: Feasible or too big of a leap for you?
- How could MAGICapp work for you, in creating, publishing and updating evidence summaries for systematic reviews?
- Want to be part of the Evidence Ecosystem?

In summary

- MAGICapp allows creation, dissemination and dynamic updating of evidence summaries, recommendations and decision aids
- Within an emerging evidence ecosystem, the BMJ-RapidRecs provide a model for rapidly responding to potentially practice-changing evidence through systematic reviews and trustworthy recommendations: Organizations fit for purpose?
- Authoring, publishing and updating of evidence summaries for systematic reviews an emerging opportunity: Will Cochrane and other review groups benefit from our services?
